

## 5.114 domain\_constraint

|                      | DESCRIPTION   | LINKS | GRAPH | AUTOMATON |
|----------------------|---|-------|-------|-----------|
| <b>Origin</b>        | [306]   |       |       |           |
| <b>Constraint</b>    | domain_constraint(VAR, VALUES)  |       |       |           |
| <b>Synonym</b>       | domain.   |       |       |           |
| <b>Arguments</b>     | VAR : <code>dvar</code><br>VALUES : <code>collection(var01-dvar, value-int)</code>  |       |       |           |
| <b>Restrictions</b>  | <code>required(VALUES, [var01, value])</code><br><code>VALUES.var01 ≥ 0</code><br><code>VALUES.var01 ≤ 1</code><br><code>distinct(VALUES, value)</code>   |       |       |           |
| <b>Purpose</b>       | <div style="border: 1px solid pink; padding: 5px;">           Make the link between a domain variable VAR and those 0-1 variables that are associated with each potential value of VAR: The 0-1 variable associated with the value that is taken by variable VAR is equal to 1, while the remaining 0-1 variables are all equal to 0.         </div>  |       |       |           |
| <b>Example</b>       | <div style="border: 1px solid blue; padding: 10px; display: inline-block;"> <math display="block">\left( 5, \left\langle \begin{array}{ll} \text{var01} - 0 &amp; \text{value} - 9, \\ \text{var01} - 1 &amp; \text{value} - 5, \\ \text{var01} - 0 &amp; \text{value} - 2, \\ \text{var01} - 0 &amp; \text{value} - 7 \end{array} \right\rangle \right)</math> </div> <p>The <code>domain_constraint</code> holds since <code>VAR = 5</code> is set to the value corresponding to the 0-1 variable set to 1, while the other 0-1 variables are all set to 0.</p> |       |       |           |
| <b>Typical</b>       | <code> VALUES  &gt; 1</code>  |       |       |           |
| <b>Symmetry</b>      | Items of VALUES are <a href="#">permutable</a> .  |       |       |           |
| <b>Usage</b>         | This constraint is used in order to make the link between a formulation using finite domain constraints and a formulation exploiting 0-1 variables.   |       |       |           |
| <b>Reformulation</b> | The <code>domain_constraint(VAR,</code><br>$\langle \text{var01} - B_1 \text{value} - v_1,$ $\text{var01} - B_2 \text{value} - v_2,$ $\dots\dots\dots$ $\text{var01} - B_{ \text{VALUES} } \text{value} - v_{ \text{VALUES} } \rangle)$ constraint can be expressed in term of the following reified constraint $(\text{VAR} = v_1 \wedge B_1 = 1) \vee (\text{VAR} = v_2 \wedge B_2 = 1) \vee \dots \vee (\text{VAR} = v_{ \text{VALUES} } \wedge B_{ \text{VALUES} } = 1)$ .  |       |       |           |
| <b>Systems</b>       | <code>domainChanneling</code> in <b>Choco</b> , <code>channel</code> in <b>Gecode</b> , <code>in</code> in <b>SICStus</b> , <code>in_set</code> in <b>SICStus</b> .   |       |       |           |

**Arc constraint(s)**value.value = values.value  $\Leftrightarrow$  values.var01 = 1**Graph property(ies)****NARC** = |VALUES|**Graph model**

The domain\_constraint constraint is modelled with the following bipartite graph:

- The first class of vertices corresponds to one single vertex containing the domain variable.
- The second class of vertices contains one vertex for each item of the collection VALUES.

*PRODUCT* is used in order to generate the arcs of the graph. In our context it takes a collection with one single item (var01 = 1 value = VAR) and the collection VALUES.

The arc constraint between the variable VAR and one potential value  $v$  expresses the following:

- If the 0-1 variable associated with  $v$  is equal to 1, VAR is equal to  $v$ .
- Otherwise, if the 0-1 variable associated with  $v$  is equal to 0, VAR is not equal to  $v$ .

Since all arc constraints should hold the final graph contains exactly |VALUES| arcs.

Parts (A) and (B) of Figure 5.227 respectively show the initial and final graph associated with the **Example** slot. Since we use the **NARC** graph property, the arcs of the final graph are stressed in bold.

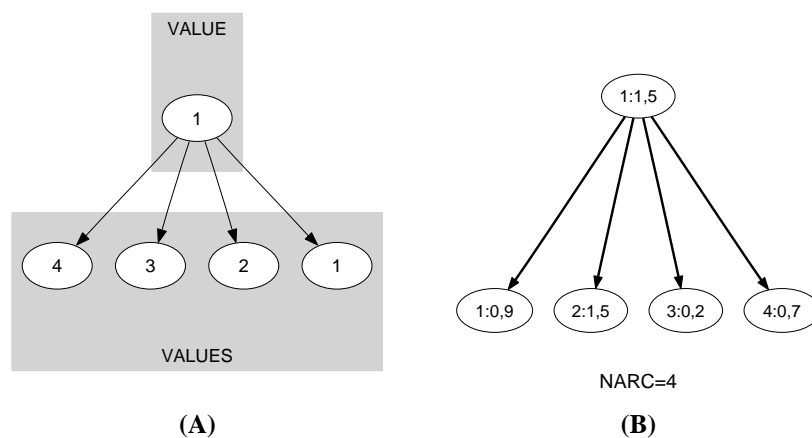

Figure 5.227: Initial and final graph of the domain\_constraint constraint

**Signature**

Since the number of arcs of the initial graph is equal to  $VALUES$  the maximum number of arcs of the final graph is also equal to  $VALUES$ . Therefore we can rewrite the graph property  $NARC = |VALUES|$  to  $NARC \geq |VALUES|$ . This leads to simplify  $NARC$  to  $NARC$ .

**Automaton**

Figure 5.228 depicts the automaton associated with the `domain_constraint` constraint. Let  $\text{VAR01}_i$  and  $\text{VALUE}_i$  respectively be the `var01` and the `value` attributes of the  $i^{\text{th}}$  item of the `VALUES` collection. To each triple  $(\text{VAR}, \text{VAR01}_i, \text{VALUE}_i)$  corresponds a 0-1 signature variable  $S_i$  as well as the following signature constraint:  $((\text{VAR} = \text{VALUE}_i) \Leftrightarrow \text{VAR01}_i) \Leftrightarrow S_i$ .
