

## 5.121 element\_product

	DESCRIPTION	LINKS	GRAPH
<b>Origin</b>	[270]		
<b>Constraint</b>	<code>element_product(Y, TABLE, X, Z)</code>		
<b>Synonym</b>	<code>element.</code>		
<b>Arguments</b>	<pre> Y      : dvar TABLE  : collection(value-int) X      : dvar Z      : dvar </pre>		
<b>Restrictions</b>	<pre> Y ≥ 1 Y ≤  TABLE  X ≥ 0 Z ≥ 0 required(TABLE, value) TABLE.value ≥ 0 </pre>		
<b>Purpose</b>	Z is equal to the $Y^{th}$ item of TABLE multiplied by X.		
<b>Example</b>	<code>(3, &lt;6, 9, 2, 9&gt;, 5, 10)</code>		
	<p>The <code>element_product</code> constraint holds since its fourth argument <math>Z = 10</math> is equal to the <math>3^{th}</math> (<math>Y = 3</math>) item of the collection <math>\langle 6, 9, 2, 9 \rangle</math> multiplied by <math>X = 5</math>.</p>		
<b>Typical</b>	<pre> X &gt; 0 Z &gt; 0  TABLE  &gt; 1 range(TABLE.value) &gt; 1 TABLE.value &gt; 0 </pre>		
<b>Usage</b>	<p>The <code>element_product</code> constraint was originally used in <a href="#">configuration problems</a> [270]. In this context, Z denotes the cost of buying X units of type Y at cost <code>TABLE[Y].value</code>.</p>		
<b>Reformulation</b>	<p>By introducing an extra variable VAL, the <code>element_product(Y, TABLE, X, Z)</code> constraint can be expressed in term of an <code>element(Y, TABLE, VAL)</code> constraint and of a product constraint <math>Z = VAL \cdot X</math>.</p>		
<b>See also</b>	<p><b>common keyword:</b> <a href="#">elem</a>, <a href="#">element</a>, <a href="#">element_greatereq</a>, <a href="#">element_lesseq</a> (<i>array constraint</i>).</p>		
<b>Keywords</b>	<p><b>application area:</b> <a href="#">configuration problem</a>.  <b>constraint type:</b> <a href="#">data constraint</a>.  <b>modelling:</b> <a href="#">array constraint</a>, <a href="#">table</a>, <a href="#">functional dependency</a>, <a href="#">variable subscript</a>.</p>		

**Derived Collection**

$$\text{col} \left( \begin{array}{l} \text{ITEM-collection}(y\text{-dvar}, x\text{-dvar}, z\text{-dvar}), \\ [\text{item}(y - Y, x - X, z - Z)] \end{array} \right)$$

**Arc input(s)**

ITEM TABLE

**Arc generator** $\text{PRODUCT} \mapsto \text{collection}(\text{item}, \text{table})$ **Arc arity**

2

**Arc constraint(s)**

- $\text{item.y} = \text{table.key}$
- $\text{item.z} = \text{item.x} * \text{table.value}$

**Graph property(ies)** $\text{NARC} = 1$ **Graph model**

We use the derived collection ITEM for putting together the Y, the X and Z parameters of the `element_product` constraint. Within the arc constraint we use the implicit attribute `key` that associates to each item of a collection its position within the collection.

Parts (A) and (B) of Figure 5.249 respectively show the initial and final graph associated with the **Example** slot. Since we use the **NARC** graph property, the unique arc of the final graph is stressed in bold.

Figure 5.249: Initial and final graph of the `element_product` constraint

**Signature**

Because of the first condition of the arc constraint the final graph cannot have more than one arc. Therefore we can rewrite  $\text{NARC} = 1$  to  $\text{NARC} \geq 1$  and simplify  $\overline{\text{NARC}}$  to  $\overline{\text{NARC}}$ .
