

**5.235 not\_in**

|                     | DESCRIPTION  | LINKS | GRAPH | AUTOMATON |
|---------------------|--|-------|-------|-----------|
| <b>Origin</b>       | Derived from <a href="#">in</a> .  |       |       |           |
| <b>Constraint</b>   | <code>not_in(VAR, VALUES)</code>   |       |       |           |
| <b>Arguments</b>    | VAR : <a href="#">dvar</a><br>VALUES : <a href="#">collection</a> (val-int)  |       |       |           |
| <b>Restrictions</b> | <a href="#">required</a> (VALUES, val)<br><a href="#">distinct</a> (VALUES, val)   |       |       |           |
| <b>Purpose</b>      | Remove the values of the VALUES collection from the domain variable VAR.   |       |       |           |
| <b>Example</b>      | <code>(2, &lt;1, 3&gt;)</code>   |       |       |           |
|                     | The constraint <code>not_in</code> holds since the value of its first argument <code>VAR = 2</code> does not occur within the collection <code>&lt;1, 3&gt;</code> .   |       |       |           |
| <b>Symmetries</b>   | <ul style="list-style-type: none"> <li>• Items of VALUES are <a href="#">permutable</a>.</li> <li>• One and the same constant can be <a href="#">added</a> to VAR as well as to the <code>val</code> attribute of all items of VALUES.</li> </ul>  |       |       |           |
| <b>Remark</b>       | <a href="#">Entailment</a> occurs immediately after posting this constraint and removing all values in VALUES from VAR.  |       |       |           |
| <b>Systems</b>      | <code>notMember</code> in <b>Choco</b> , <code>rel</code> in <b>Gecode</b> .   |       |       |           |
| <b>Used in</b>      | <a href="#">group</a> .  |       |       |           |
| <b>See also</b>     | <b>negation:</b> <a href="#">in</a> .  |       |       |           |
| <b>Keywords</b>     | <b>characteristic of a constraint:</b> <a href="#">disequality</a> , <a href="#">automaton</a> , <a href="#">automaton without counters</a> , <a href="#">reified automaton constraint</a> , <a href="#">derived collection</a> .<br><b>constraint arguments:</b> unary constraint.<br><b>constraint network structure:</b> centered cyclic(1) constraint network(1).<br><b>constraint type:</b> value constraint.<br><b>filtering:</b> arc-consistency, entailment.<br><b>modelling:</b> excluded, domain definition. |       |       |           |

|                            |  |
|----------------------------|--|
| <b>Derived Collection</b>  | $\text{col}(\text{VARIABLES} - \text{collection}(\text{var} - \text{dvar}), [\text{item}(\text{var} - \text{VAR})])$ |
| <b>Arc input(s)</b>        | VARIABLES VALUES   |
| <b>Arc generator</b>       | $\text{PRODUCT} \mapsto \text{collection}(\text{variables}, \text{values})$  |
| <b>Arc arity</b>           | 2  |
| <b>Arc constraint(s)</b>   | $\text{variables.var} = \text{values.val}$   |
| <b>Graph property(ies)</b> | $\text{NARC} = 0$  |

**Graph model**

Figure 5.448 shows the initial graph associated with the **Example** slot. Since we use the  $\text{NARC} = 0$  graph property the corresponding final graph is empty.

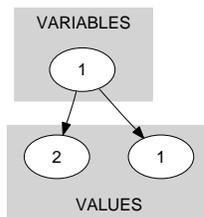

Figure 5.448: Initial graph of the `not_in` constraint (the final graph is empty)

**Signature**

Since 0 is the smallest number of arcs of the final graph we can rewrite  $\text{NARC} = 0$  to  $\text{NARC} \leq 0$ . This leads to simplify  $\text{NARC}$  to  $\text{NARC}$ .

**Automaton**

Figure 5.449 depicts the automaton associated with the `not_in` constraint. Let  $VAL_i$  be the `val` attribute of the  $i^{th}$  item of the `VALUES` collection. To each pair  $(VAR, VAL_i)$  corresponds a 0-1 signature variable  $S_i$  as well as the following signature constraint:  $VAR = VAL_i \Leftrightarrow S_i$ .
